

# Deep Learning for Medical Image Segmentation & Classification

**Dr. Arna Fariza, S.Kom., M.Kom**

Webinar Medical Engineering

Program Pasca Sarjana

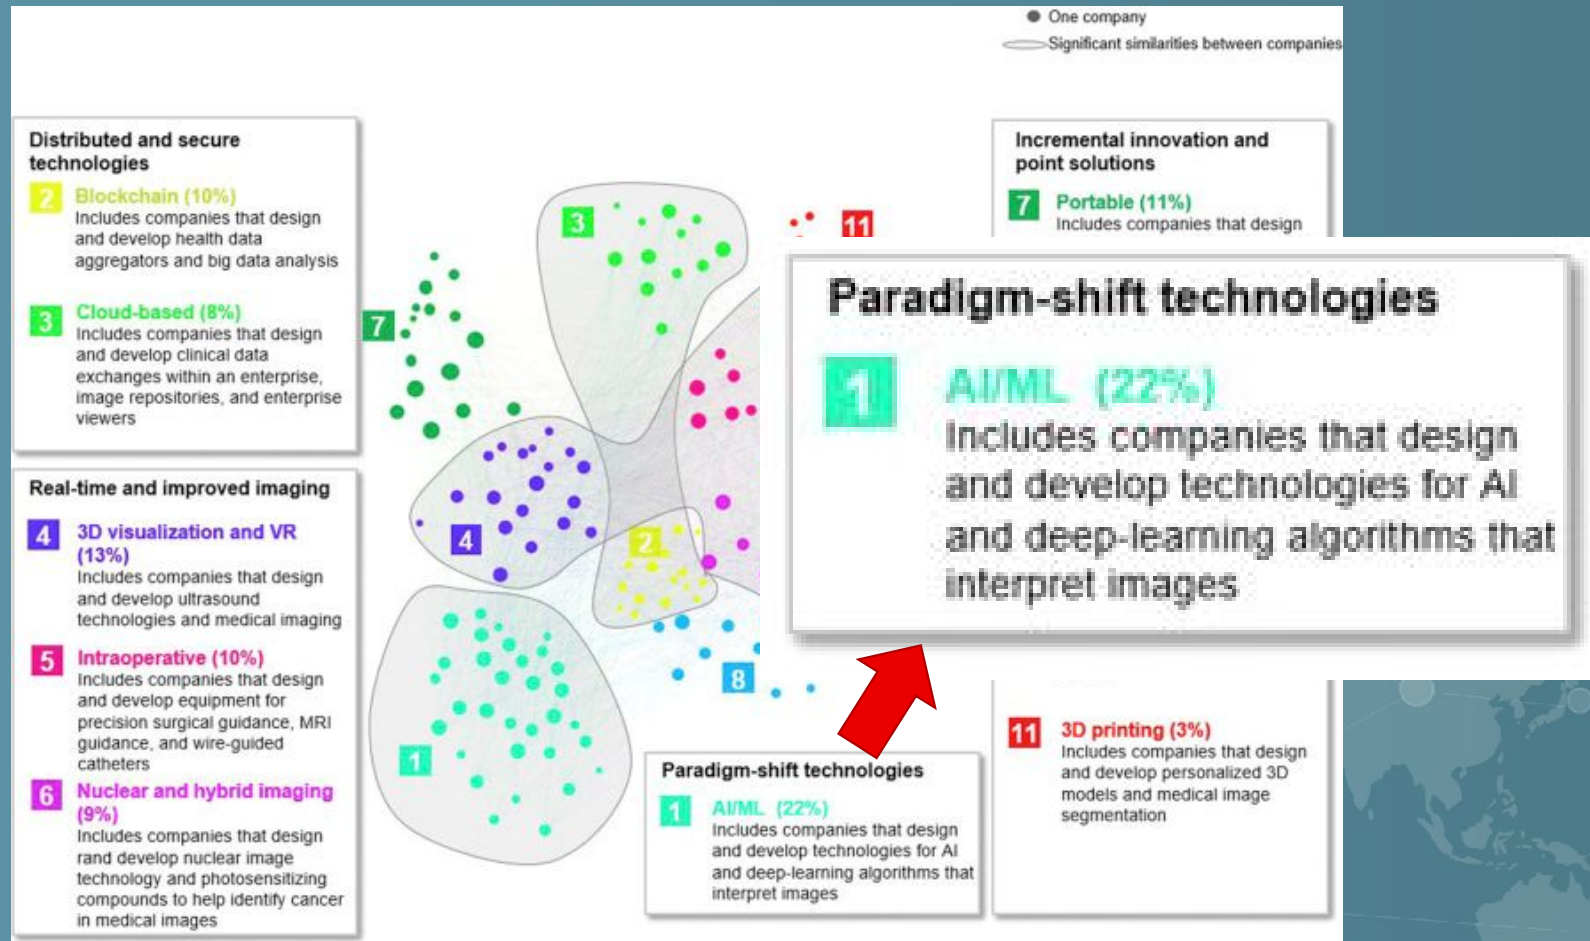

Politeknik Elektronika Negeri Surabaya

# Background

- The discovery of X-ray in 1895 initiated the era of medical imaging diagnostics.
- Significant development in medical imaging technologies, processing medical images pose a substantial challenge by the implementation of digital medical image processing.
- Improve medical practice and refine health care systems all over the world
- Early detection of diseases
- Support accurate diagnosis and develop automated computer-aided diagnosis systems (CADs).

# CLUSTER MAPPING FOR MEDICAL IMAGING

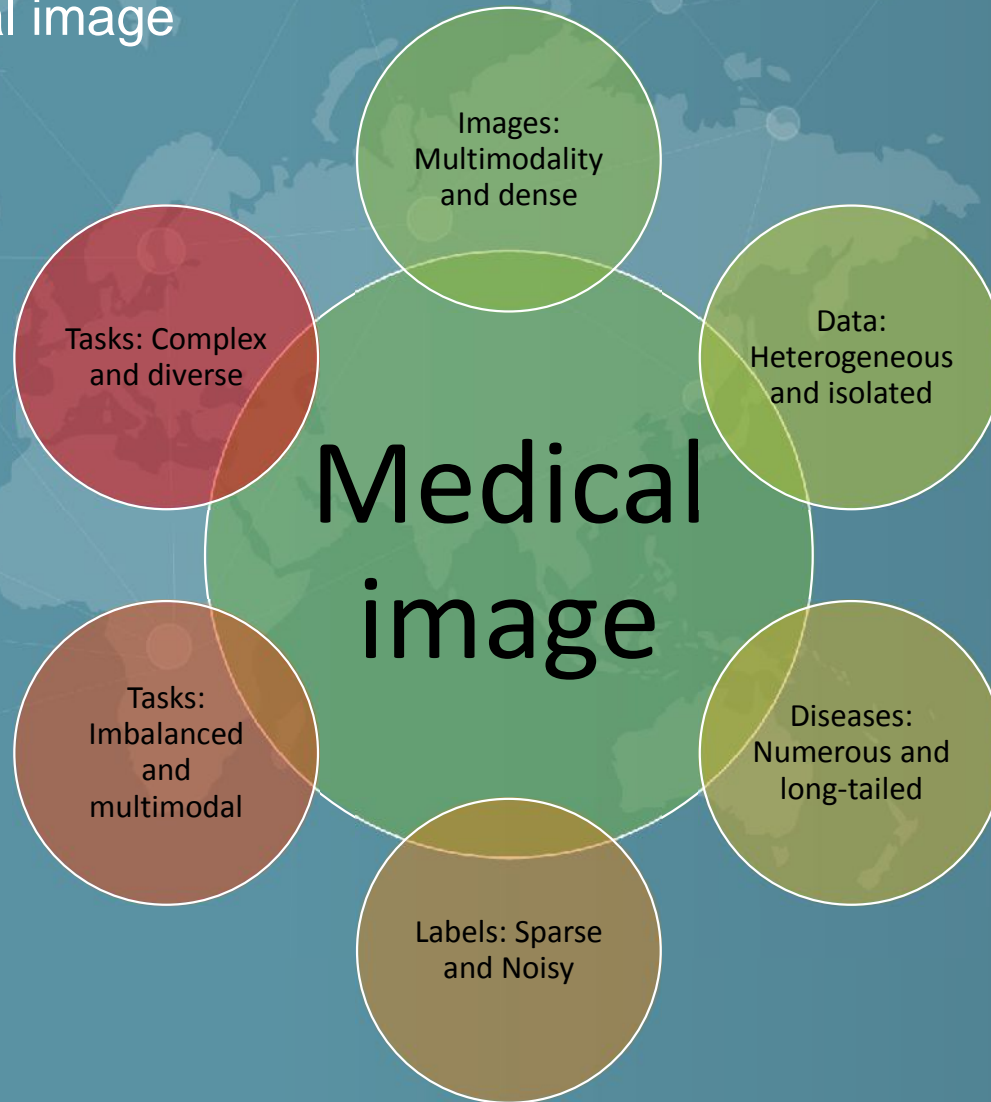

McKinsey analysis (McKinsey & Company, New York, New York) , S&P Capital IQ (New York, New York), and PitchBook Data Inc (Seattle, Washington)

# Medical imaging

- Electromagnetic radiation, radioactivity, nuclear magnetic resonance, and sound to generate visual representations or images of internal tissues of the human body or a part of the human body in a non-invasive manner.
- X-ray radiography, computed tomography (CT), magnetic resonance imaging (MRI), and ultrasound (US) for about 90% of all healthcare data
- Most of the medical images have noise, intensity inhomogeneity, and weak boundaries, which require complex procedures

## Main traits of Medical image (Kevin Zhou 2020)

# CT Image

Chest CT Image

Brain CT Image

# MRI Image

Brain MRI

Whole-Body MRI

Lung cysts

# Ultrasound Image

Liver Disease images

Carotid artery

# X-ray Image

Chest X-ray

Bone X-ray

Panoramic radiography

# Optical Coherence Tomography

Retinal Blood Vessel

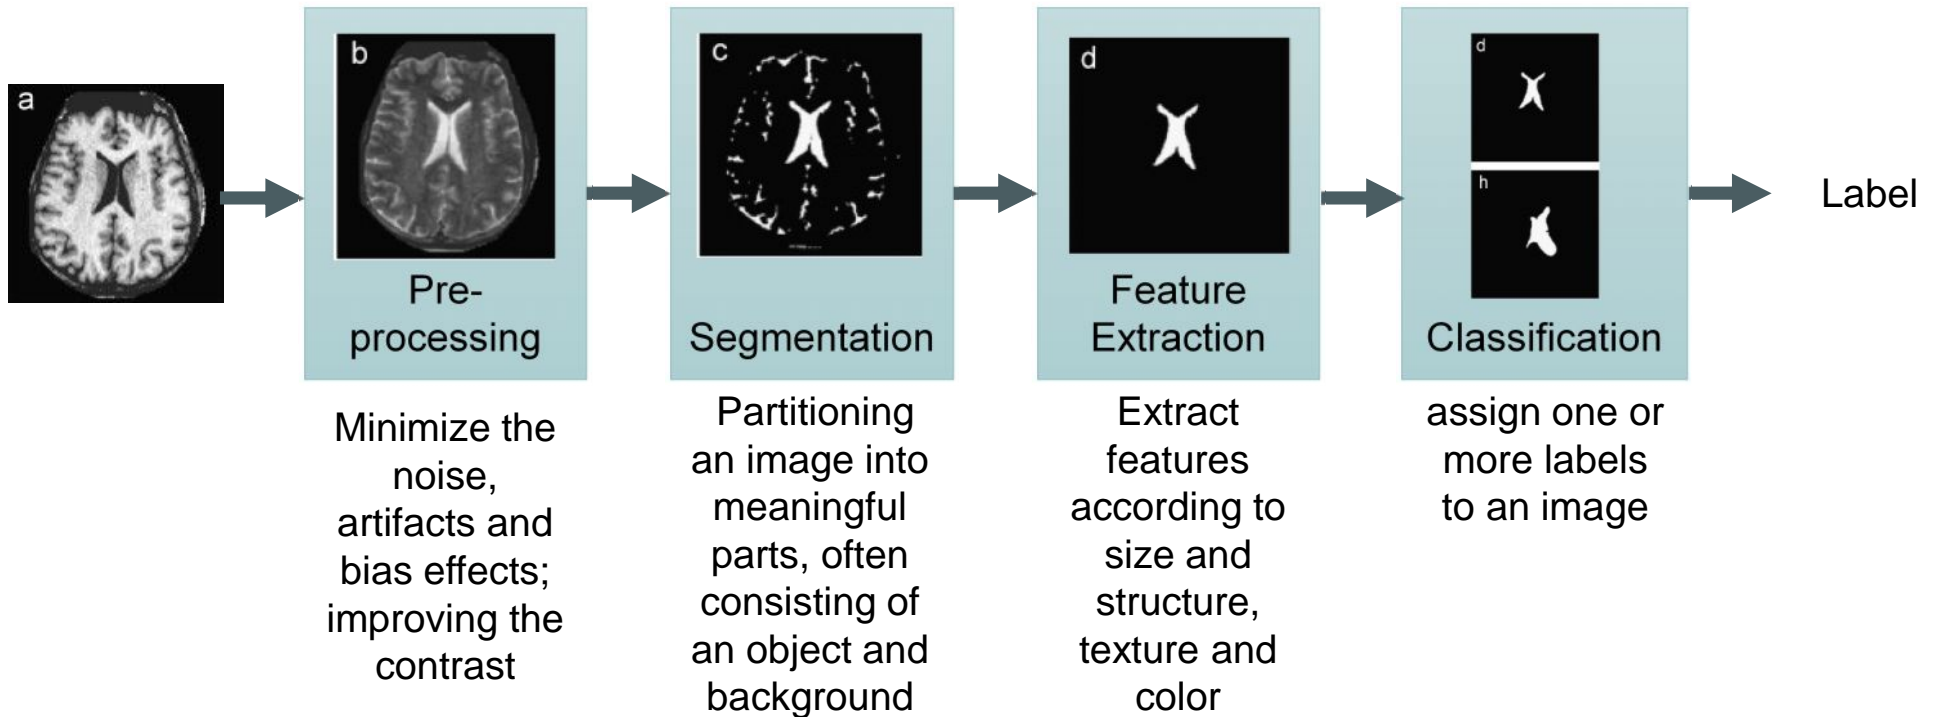

Diabetic Retinopathy

# Cone-Beam Computed Tomography (CBCT)

# Medical Images Acquisition

# Image Segmentation

- Image Segmentation: extracts the region of interest (ROI) through an automatic or semiautomatic process
- Thresholding: Otsu
- Clustering : extracting the global characteristics of the image to professionally separate the ROI from the background
  - Hierarchical clustering, Divisive clustering, Mean shift clustering, K-Means, Fuzzy C-Means (FCM)
- Region-based:
  - Region merging, Region growing, Active contour
- Graph-cut methods: choosing seed points representing some pixels to belong to the object and other pixels from the background.
- Semi-automatic: user interaction is applied before segmentation process

# Image Classification

Fused Medical Image	I	II	III	IV	V	VI	VII
Class	Malignant	Benign	Benign	Malignant	Malignant	Malignant	Benign
Accuracy	92.22	96.22	98.41	89.56	96.58	92.1	93.89

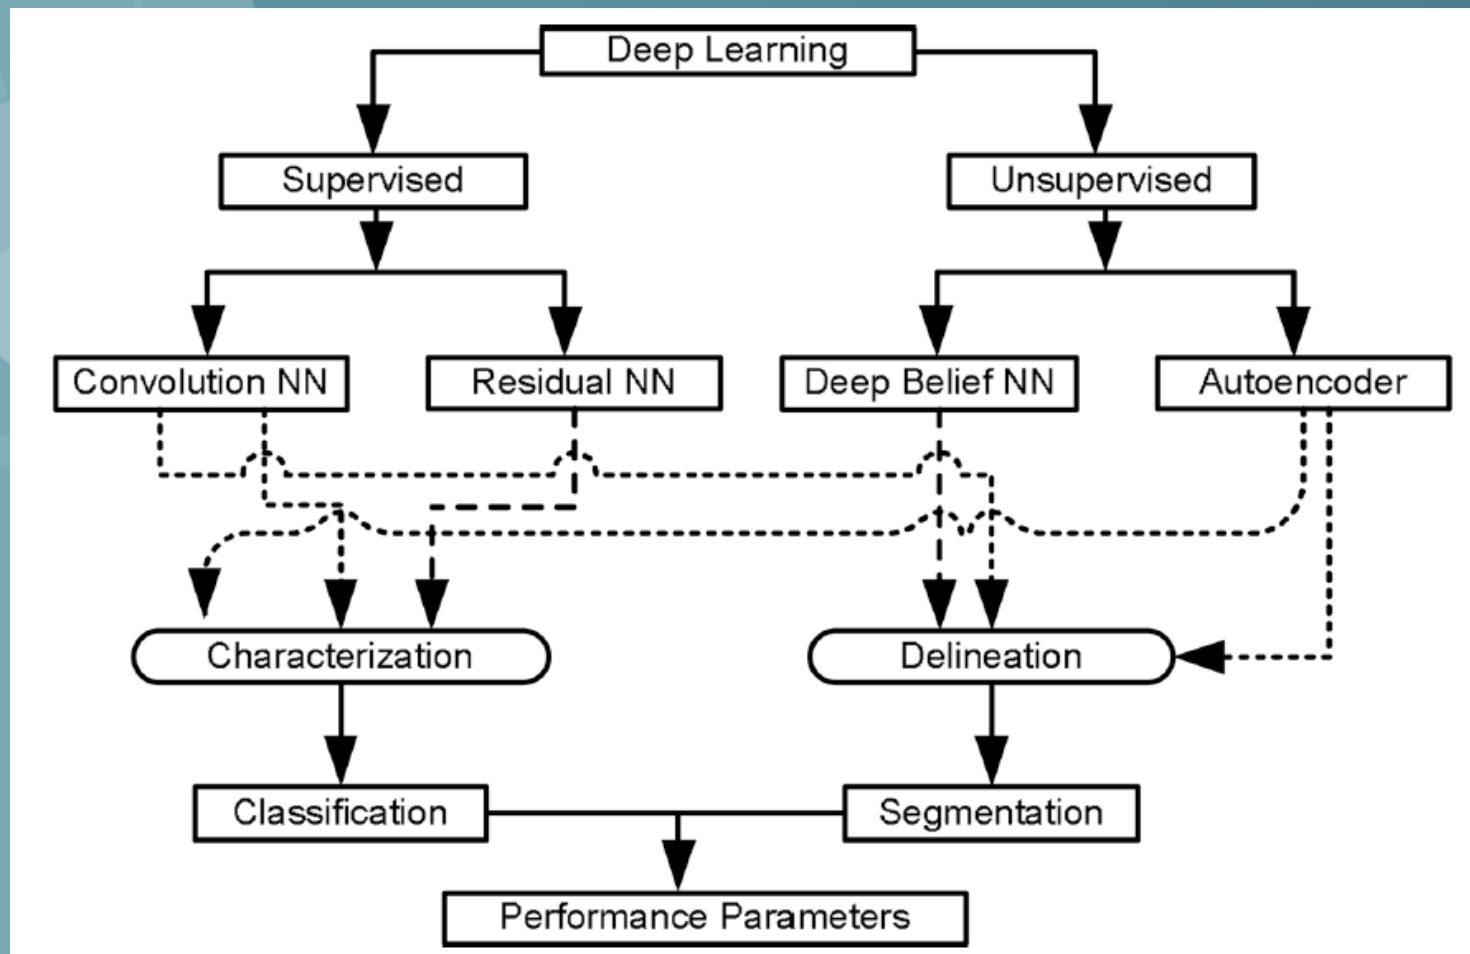

- Preceded by segmentation and feature extraction.
- Concerns the training of classification models on a training set
- Develops the classification of whole screen using the best performing classifier
- Statistical and classical:
  - Bayesian
  - Linear discriminant analysis
  - K-Nearest Neighbor
  - Support Vector Machine (SVM)
- Artificial Intelligent:
  - Neural Network
  - Fuzzy Logic
  - Decision Tree
  - Genetic Algorithm

# DEEP LEARNING

- Worldwide interest in artificial intelligence (AI) applications, including imaging, is high and growing rapidly
- Availability of large datasets ("big data")
- Substantial advances in computing power
- Success measured: increased diagnostic certainty, faster turnaround, better outcomes for patients, and better quality of work life for observer (doctor/radiologist)

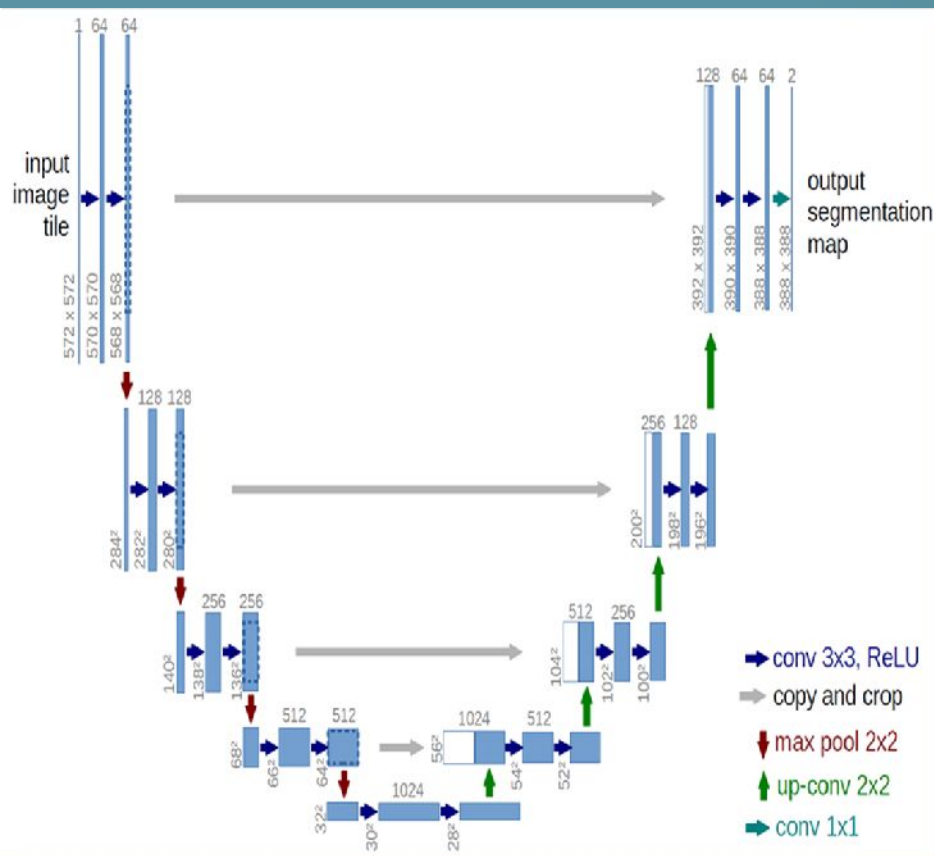

# DL for Medical Image

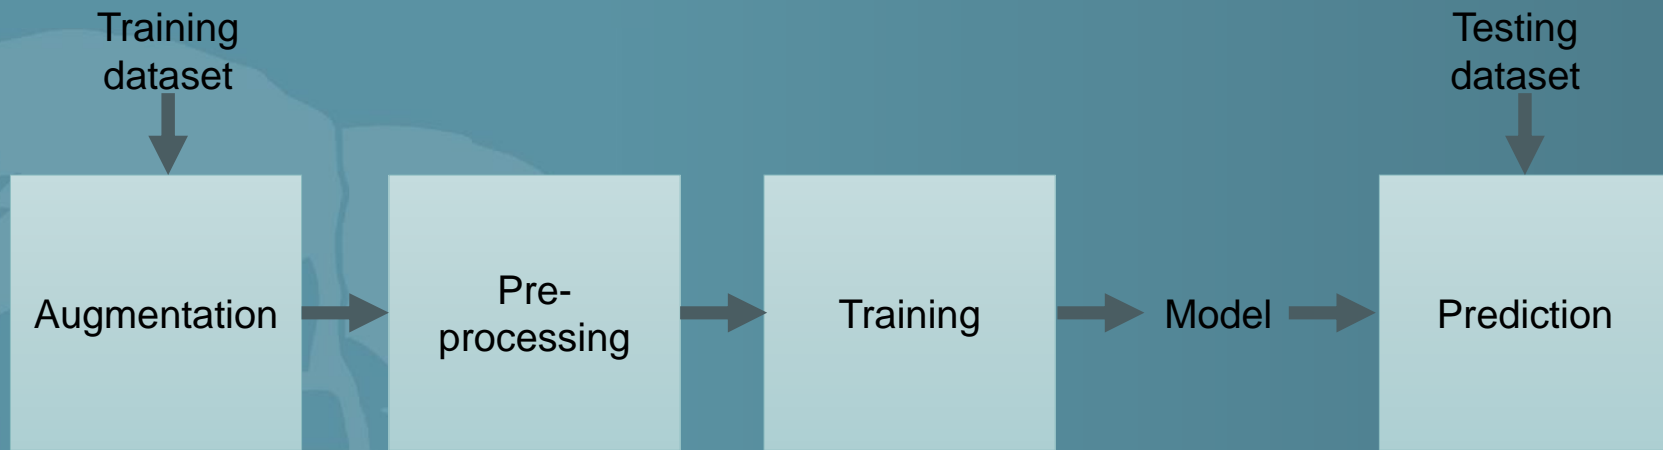

# Segmentation using U-NET (Ronneberger et al., 2015)

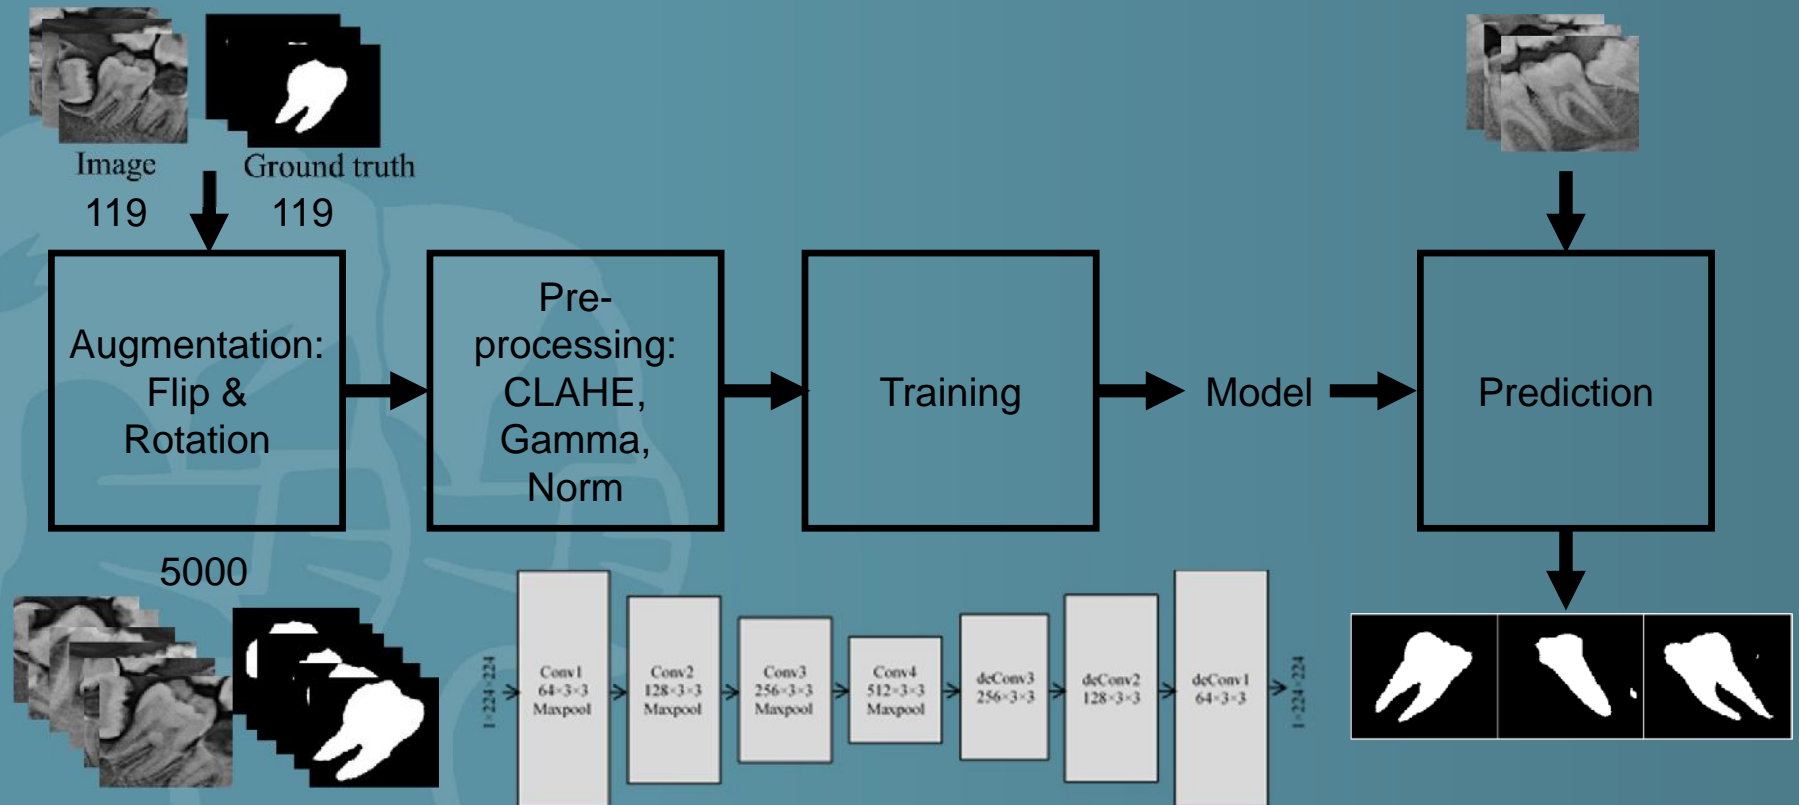

- In biomedical image processing, the desired output should include localization, i.e., a class label is supposed to be assigned to each pixel
- It consists of a contracting path / down sampling (left side) and an expansive path / up sampling (right side)
- Contracting path: two 3x3 convolutions, ReLU, a 2x2 max pooling
- Expansive path: up sampling of the feature map, 2x2 convolution concatenation with the correspondingly cropped feature map from the contracting path, two 3x3 convolutions, ReLU.

# Methodology of Medical Image Segmentation & Classification

# Dental X-ray Segmentation using U-NET

# Dental X-ray Segmentation using UNET

- Requires ground truth for the training process
- The amount of data is relatively small, with augmentation will effectively produce superior segmentation

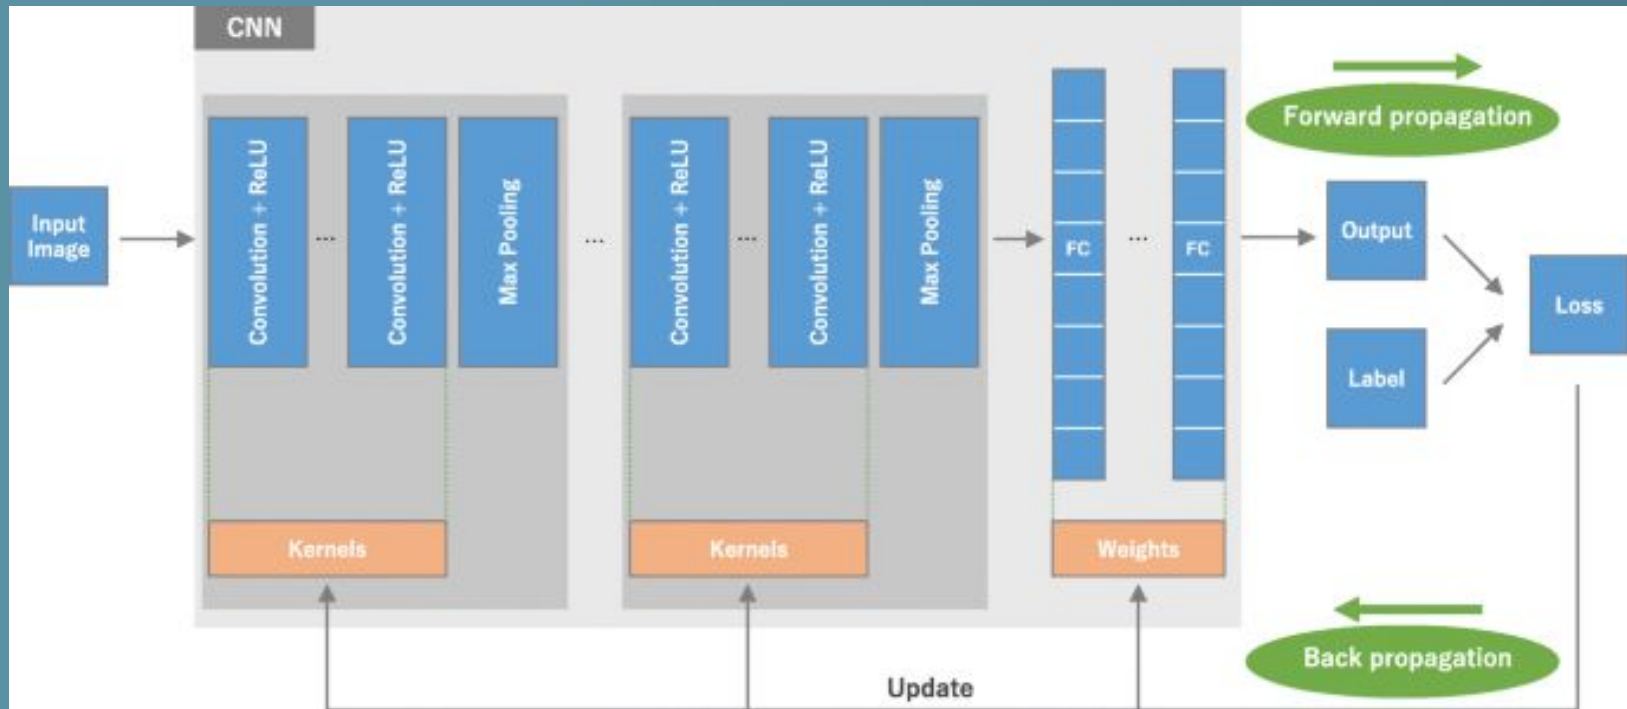

# Convolutional Neural Network

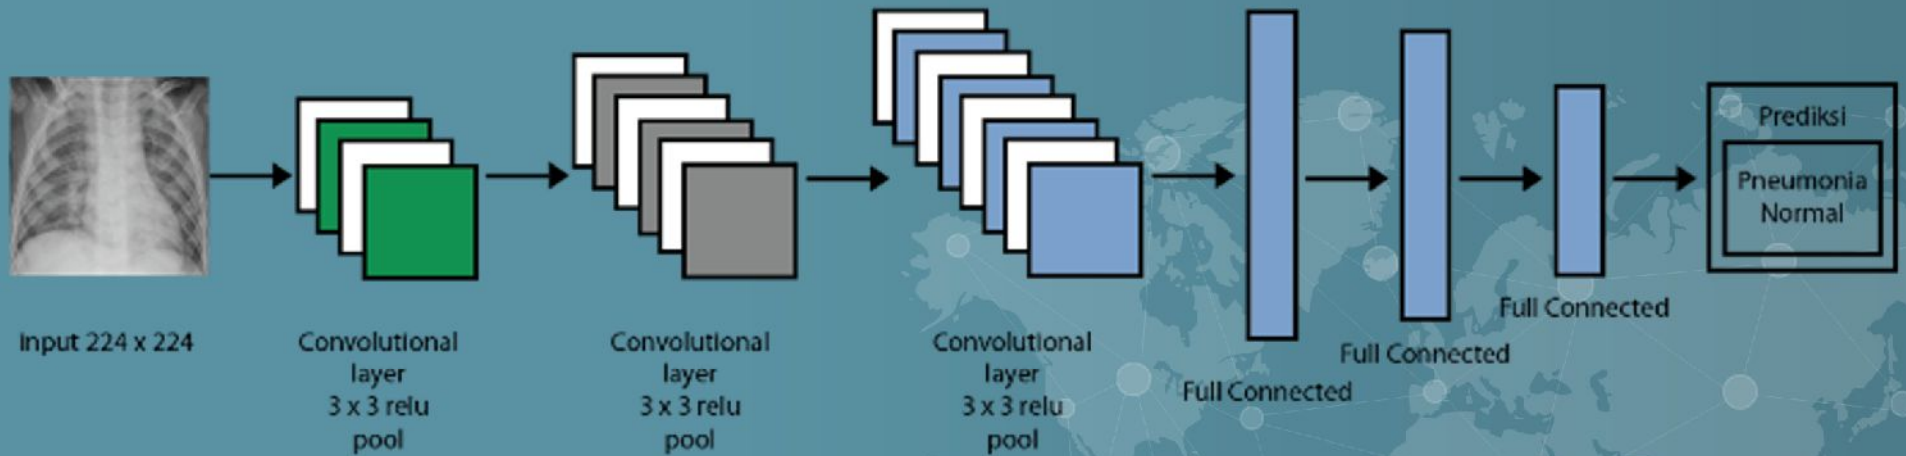

- In traditional image classification, low-level or mid-level features are extracted to represent the image and a trainable classifier is then used for label assignments.
- The high-level feature representation of deep convolutional neural networks has proven to be superior to hand-crafted low-level and mid-level features.
- In the deep convolutional neural network, both feature extraction and classification networks are combined together and trained end-to-end.
- Convolution: to generate features from the image.
- Classifier: to classify the image based on the detected features.

# Transfer Learning

- Transfer learning is a popular method in computer vision because it allows us to **build accurate models in a timesaving way** (Rawat & Wang 2017).
- transfer learning is usually expressed through the use of **pre-trained models**.
- A pre-trained model is a model that was trained on a large benchmark dataset to solve a problem similar to the one that we want to solve.
- Fine-tune strategies:
  1. Train the entire model
  2. Train some layers and leave the others frozen
  3. Freeze the convolutional base

Source: Pedro Marcelino *Transfer learning from pre-trained models*

# Fine-tune Model

Source: Pedro Marcelino Transfer learning from pre-trained models

# Classifier

1. **Fully-connected layers.** Use a stack of fully-connected layers followed by a softmax activated layer (Krizhevsky et al. 2012, Simonyan & Zisserman 2014, Zeiler & Fergus 2014).
2. **Global average pooling.** Instead of adding fully connected layers on top of the convolutional base, add a global average pooling layer and feed its output directly into the softmax activated layer (Lin et al. 2013)
3. **Linear support vector machines.** training a linear SVM classifier on the features extracted by the convolutional base (Tang 2013)

## TORCHVISION.MODELS

The models subpackage contains definitions of models for addressing different tasks, including: image classification, pixelwise semantic segmentation, object detection, instance segmentation, person keypoint detection and video classification.

### Classification

The models subpackage contains definitions for the following model architectures for image classification:

- [AlexNet](#)
- [VGG](#)
- [ResNet](#)
- [SqueezeNet](#)
- [DenseNet](#)
- [Inception v3](#)
- [GoogLeNet](#)
- [ShuffleNet: v2](#)
- [MobileNet v2](#)
- [ResNeXt](#)
- [Wide ResNet](#)
- [MNASNet](#)

You can construct a model with random weights by calling its constructor:

## Loss Functions

- nn.L1Loss** Creates a criterion that measures the mean absolute error (MAE) between each element in the input  $X$  and target  $y$ .
- nn.MSELoss** Creates a criterion that measures the mean squared error (squared L2 norm) between each element in the input  $X$  and target  $y$ .
- nn.CrossEntropyLoss** This criterion combines `nn.LogSoftmax()` and `nn.NLLLoss()` in one single class.
- nn.CTCLoss** The Connectionist Temporal Classification loss.
- nn.NLLLoss** The negative log likelihood loss.
- nn.PoissonNLLLoss** Negative log likelihood loss with Poisson distribution of target.
- nn.KLDivLoss** The 'Kullback-Leibler divergence' Loss
- nn.BCELoss** Creates a criterion that measures the Binary Cross Entropy

# On Going Research

- Age estimation based on face recognition
- Age estimation based on dental X-ray images
- Detection of Blindness disease on OCT Image
- Identification of Signature Validity
- Detection of the patient's level of emergency based on facial expressions
- Age estimate based on X-ray images
- Panoramic radiography segmentation

THANK YOU
